## TO FIND COLOGARITHMS OF NUMBERS.

TAKE out the logarithm from the table of logarithms, and subtract it (characteristic as well as mantissa) from 10 in the following manner: subtract every figure from 9, proceeding from left to right, to the last significant figure, which subtract from 10. Cast out as many tens in characteristic of result as there have been cologarithms used.

Thus, to find log. 5806 − log. 4814 + log. 8192 − log. 612, using addition only:—

| | | |
|---|---|---|
| log. | 5806 . . . . . | 3·724767 |
| colog. | 4814 . . . . . | 6·317494 |
| log. | 8192 . . . . . | 3·913390 |
| colog. | 612 . . . . . | 7·213249 |
| | log. 14·76 . . . . . | 1·168900 |

N.B. The cologarithm may thus be taken *by sight* from a table of logarithms, by persons accustomed to the use of tables, as easily as the logarithm itself, and with greater security from material error, than from a table of cologarithms. The rule for finding the characteristic of the cologarithm differing from the rule by which the characteristic of the logarithm is found, some considerable probability of serious error is involved in the use of tables of cologarithms.

In the case of negative characteristics, their subtraction from 9 being apparently an addition, it is often as well to cast out the 10 from the cologarithm at once before proceeding to sum.

Thus, to find log. 53·06 − log. ·04814 + log. 8·192 − log. ·00612:—

| | | | |
|---|---|---|---|
| log. | 53·06 | = . . . | 1·724767 |
| colog. | ·04814 | = . . . | ×1·317494 |
| log. | 8·192 | = . . . | 0·913390 |
| colog. | ·00612 | = . . . | ×2·213249 |
| | | | 6·168900 |

N.B. To correct Auxiliary Angle, multiply the Factors answering to the Apparent Altitude of each body by the corrections from table for correcting Mean Refraction, and apply the products to the Auxiliary Angle the contrary way to that directed in the Table "For correction of Mean Refraction."

Fahrenheit = Centigr. $\times \frac{9}{5} \pm 32° =$ Reaumur $\times \frac{9}{4} \pm 32°$.
